Department of Geography, Faculty of Exact and Natural Science,  
Ivane Javakhishvili Tbilisi State University

The cartography has now reached 8 main conceptual systems. These concepts are based on three major components of cartography as academic science: subject, language and method. The work is presented in the cartography of the already strongly-concepted concept of cartosemyotics in the history of prehistoric times (with primitive maps). According to the materials and research used in the work is based on the so-called Cartosemyotics “pyramid” in relation to time. Authors' views and basic provisions of the presented work are comparable to the key researchers of cartosemyotics and the conceptual authors of the concept.
